

HOME PROOFOLIO

Project Product Requirements Document

Version 0.3 — Expanded Project Reference

Build. Prove. Connect.

A universal professional identity, proof-of-work, learning, problem-solving and collaboration platform.

Core journey: Learn → Think → Build → Solve → Prove → Connect → Grow

1. Product Vision

HOME PROOFOLIO is a global platform where any person can build a living professional identity and show what they have learned, created, solved, contributed to and achieved.

It must work for a child, student, developer, designer, footballer, researcher, founder, business owner, employee or professional. It must not force everyone into a developer-style portfolio.

Core principle: one person can have many roles, many interests, many kinds of work and many forms of evidence.

2. Users

Children and young learners; students; developers and engineers; designers and creators; athletes and footballers; researchers and academics; founders and business owners; employees and professionals; and visitors who only want to explore public content.

3. Public Visitor Experience

Anyone can visit a public profile without an account.

Anonymous visitors can view eligible public profiles, roles, work, achievements, learning, articles, organizations, evidence and public discussions.

Viewing is public; participation requires authentication. Following, commenting, reacting, joining discussions, submitting problems, proposing solutions, messaging, collaborating, associating and saving/watching content require an account.

After authentication, the system should continue the intended action where practical.

4. Account and Identity

An account represents a person using the platform. Users can register, log in, manage their profile, choose a public username/URL, manage visibility and maintain their professional journey.

The profile is a living identity rather than a static CV. It grows as the person adds work, learning, achievements, relationships and evidence.

5. Multi-Role Identity

A person must not be forced to choose one profession.

Example: Amina — Accounting Student | Founder | Pharmacy Manager.

Amina can connect herself to XYZ Pharmacy as Founder/Manager while keeping education, skills, projects, learning and achievements on the same identity.

Relationship: Person → Role → Organization.

6. Universal Work / Project Model

The platform uses a universal Work/Project concept instead of assuming every user creates software.

Every work item has a small common core such as title, description, context/role, date, skills/capabilities, visibility and evidence.

Universal Core + Domain Templates + Custom Attributes.

Users can add multiple values, skip irrelevant fields and add custom attributes. Templates guide the user but do not limit them.

7. Adaptive Work Examples

Developer: title, problem/goal, role, technologies, repository, live URL, documentation and evidence.

Graphic Designer: title, description/goal, role, creative skills, design category, tools, client/context, design files, preview and evidence.

Footballer: title, description/goal, role, team, position, competition, season, performance, match video/photos and evidence.

Young learner: what they made/did, what they learned, date and optional photo/video.

The same product capability should support all of these without showing irrelevant fields.

8. Work Lifecycle

Idea → Discovery → Planned → Building → Blocked → Testing → Deployed → Completed → Archived.

Each state should tell the truth about maturity. Unfinished work is allowed and must not be presented as completed.

9. Proof and Evidence

HOME PROOFOLIO should answer: **Where is the proof?**

Evidence can include screenshots, images, videos, documents, certificates, repositories, deployments, test results, diagrams, research files, match footage, design files, business documents and other suitable artifacts.

Evidence can have its own visibility. Sensitive evidence can remain private while the parent work is public.

Evidence chain: Skill → Work → Problem → Artifact → Outcome.

10. Skills and Capabilities

Skills are not restricted to technology. They can be technical, creative, business, academic, sports, communication, leadership or other capabilities.

Skills become more meaningful when connected to real work, learning or evidence. Do not label every capability as a technology.

11. Ideas & Learning Journal

Users can capture an idea or discovery immediately, including source, date, questions, current understanding and notes.

Lifecycle: New → Exploring → Learning → Understanding → Testing → Turned into Project.

An idea may remain private, become a learning record, become a problem, become an experiment or become a project.

Relationship: Idea → Learning → Problem → Experiment → Project → Evidence.

12. Learning and Growth

Learning records can contain goals, resources, practice, blockers, reflection, evidence and the next practical action.

Learning can connect to skills, projects, ideas, problems, experiments, certificates and achievements.

13. Problem-Solving Network

Problems are first-class content. A user can submit a real problem for discussion or invite another person to work on it.

Lifecycle: Open → Discussing → Solving → Solved → Accepted → Closed.

Authenticated users can follow problems, discuss them and propose solutions. Contributors can be recognized.

Relationship: Problem → Discussion → Proposal → Contribution → Solution → Project → Evidence.

14. Organizations and Businesses

Organizations and businesses are first-class entities.

Example: XYZ Pharmacy can have About, Services, Products, Updates, Projects, Team and Contact.

People can connect to organizations through roles such as Founder, Manager, Employee, Mentor, Member or Collaborator.

Relationship: Person → Role → Organization.

15. Follow, Watch and Associations

Follow: one-way relationship for receiving updates from a person or organization.

Watch: follow a specific project, problem, article or discussion without following the entire person.

Association/Connection: richer relationship such as colleague, mentor, student, collaborator, project partner, research partner or professional connection.

Following must not automatically mean professional association.

16. Discussion and Engagement

Public projects, articles, labs and problems can support comments and discussion when enabled.

Users can ask questions, provide suggestions, report bugs or express collaboration interest.

Visitors can read public discussions anonymously but must authenticate to participate.

17. Professional Feed

The feed focuses on meaningful activity: new work, solved problems, learning milestones, achievements, certificates, articles, research, collaborations and organization updates.

It is not intended to become a generic social-media posting system.

18. Messaging, Real-Time and Live

Authenticated users can communicate through professional messaging.

Future real-time behavior can include presence, typing, live discussions and collaboration.

Live sessions can support demonstrations, learning, project walkthroughs, research and discussion. A replay can be connected to the related work.

19. Communities

Communities can organize people around cybersecurity, development, design, business, research, entrepreneurship, sports, students and other domains.

Communities can contain discussions, projects, resources, events and contributions while preserving original authorship.

20. Contributions and Recognition

A user may contribute to another person's project, problem, article, organization or community.

The system must distinguish original ownership/authorship from contribution.

Where appropriate, an owner can acknowledge or verify a contribution, creating evidence of meaningful participation.

21. Articles, Research and Profile Contributions

Users can publish articles and research records.

A user can request that work be associated with another profile or community.

The original author must remain clearly identified. The profile owner can accept, reject, feature or classify accepted work as a contribution/collaboration.

22. CV

CV output should use existing profile and proof records instead of requiring duplicate data entry.

Different views can be generated for general, technical, academic, business or custom purposes while keeping one source of truth.

23. Visibility and Privacy

Public: discoverable and viewable by anyone.

Unlisted: accessible through a direct link but not normally discoverable.

Private: visible only to the owner or explicitly authorized people.

Draft: unfinished and not published.

Visibility applies to profiles and individual content. Evidence may have different visibility from its parent work.

24. Search and Discovery

Anyone can discover eligible public people, projects, organizations, skills, problems, articles, learning records and other public content.

Discovery must not assume developer-only terminology.

25. Experience Modes

Simple: plain language, problem, result and visual proof.

Professional/Technical: deeper decisions, tools, implementation, evidence and trade-offs where relevant.

Journey: dates, milestones, progress and changes over time.

26. Cybersecurity Content

Cybersecurity learning should focus on authorized labs, intentionally vulnerable environments, CTFs and defensive learning.

Sensitive evidence should support appropriate privacy and redaction.

27. Safe Portfolio Terminal

A future terminal can expose curated commands such as ls, cd, tree, help, cat, open, projects, skills, labs and journey.

It must navigate public portfolio content only and never execute arbitrary server commands.

28. Main Relationship Model

Person → Role → Organization

Person → Work → Evidence

Person → Skill → Work / Learning / Evidence

Person → Idea → Learning → Problem → Experiment → Project → Evidence

Person → Problem → Discussion → Contribution → Solution → Project

Person → Follow / Watch / Association → Person / Organization / Content

Person → Article / Research → Discussion / Contribution

29. Authentication Rules

Anonymous users can view eligible public profiles and content.

Account creation/login is required for participation.

Private content always requires authorization.

After authentication, the system should continue the intended action where practical.

30. Product Rules

Do not force every person into a developer portfolio.

Do not call every skill a technology.

Do not show irrelevant fields.

Do not require duplicate CV data.

Do not expose private/draft content.

Do not confuse following with association.

Do not confuse contribution with authorship.

Do not present unfinished work as completed.

Reveal advanced fields progressively to keep the interface simple.

31. Dynamic Form Principle

Start with a small universal form. The selected work type/context reveals relevant fields.

Users can add multiple values, skip fields, add custom attributes and return later.

Backend behavior should use a stable common core plus flexible attributes and reusable field/template definitions.

Schema can evolve without changing this functionality.

32. Current Implementation Priority

First make authentication/profile/public viewing, multi-role identity, universal work creation, dynamic attributes/templates, evidence, visibility, skills, ideas/learning and core relationships reliable.

Then build advanced messaging, real-time, communities, live, reputation, analytics and future intelligence on top of the foundation.

33. Coding Agent Guidance

Treat this PRD as the functional source of truth.

Inspect the existing system before changing it.

Preserve working UI and functionality unless a change is required by this PRD.

Do not create separate profession-specific models for every domain.

Keep ownership, authorship, contribution and association distinct.

Keep public/private authorization strict.

Use the existing Django/PostgreSQL direction and update the schema as needed.

Implement one stage at a time, test the complete user flow, fix regressions and then continue.

Do not implement future features merely because they appear in this document; follow the current implementation stage.

ADDITIONAL SUGGESTIONS & FUTURE IDEAS

These are optional ideas only. They are NOT part of the current core requirements and should not be treated as mandatory implementation scope.

Personal Dashboard Customization

Allow users to rearrange dashboard sections and choose which content blocks appear first.

Work Timeline

Show projects, learning, achievements, roles and milestones chronologically.

Evidence Collections

Group multiple proof items into a single case study or evidence collection.

Case Study Mode

Present a work item as problem → context → approach → decisions → build → validation → result → evidence → lessons.

Collaboration Workspace

For multi-person work, provide shared milestones, tasks and contribution records while preserving authorship.

Verified Contributions

Allow organizations or project owners to verify genuine participation in a later phase.

Public Profile Themes

Offer a small set of professional layout variations without excessive customization.

CV / Portfolio Export

Generate different CV or portfolio versions from the same source of truth.

Activity History

Maintain meaningful history of project progress and important changes.

Saved Discovery

Allow authenticated users to save people, organizations, projects, problems and learning resources.

Explainable Reputation

If reputation is introduced, make it evidence-based and explainable rather than a generic popularity score.

Public API

Eventually expose selected public profile data to personal websites and integrations.

Import Tools

Allow selected information to be imported from existing CVs or portfolios.

Accessibility

Build strong keyboard navigation, readable contrast, reduced-motion support and screen-reader compatibility.

Organization Verification

Allow organizations to verify official profiles and selected roles or contributions.

Fine-Grained Evidence Privacy

Support sensitive client work, private documents and redacted public case studies.

FINAL PRODUCT PRINCIPLE

One platform. One identity. Many roles. Many kinds of work. Many forms of proof. One connected professional journey.

HOME PROOFOLIO should help a person show not only what they claim to be, but what they have learned, built, solved, contributed to and proved.
